Dec 48

"The Nettle's Burning Mechanism," D. V. Lebedev,  
 $\frac{1}{2}$  p

"Priroda" No 12

According to research conducted by Emmelin and Feldberg (Jour of Physiol, 106, 440, 1947) burning is caused by histamine contained in the nettle's spines. The nettle usually contains 0.005-0.022 $\frac{1}{4}$ g of this substance in concentrations of 1:1,000 to 1:500. Presence of 0.031-0.135 $\frac{1}{4}$ g acetylcholine in the plant was also determined.

"Review of 'Russian Botanists. A Biographical and  
Bibliographical Dictionary. Vol I.' by S. Yu.  
Lipshits," D. V. Lebedev, 3 pp  
*Botanical Inst. im. Komarov, AS USSR, Leningrad*  
"Priroda" Vol XXXVII, No 2

This is first volume of new work which will comprise  
ten volumes when complete. It will contain biogra-  
phies of about 8,000 Russian botanists and workers  
in associated fields from 1725 to 1941. List of  
sources is appended to each article. Review is, on  
the whole, favorable.

Feb 1948

"Yperite and Mutations," D. V. Lebedev, 2 pp

"Priroda" Vol XXXVII, No 2

Recent medicobiological investigations of mustard gas have shown that it (1) attacks enzymatory apparatus of cell; (2) affects nucleus; in particular, mitotic activity is decreased. Larger doses split nucleus resulting in chaotic dissemination of chromatin. Various investigators have utilized this fact for producing artificial mutations. Chiefly US and British sources; one Russian reference.

USSR/Medicine - Institutes, Research      Apr 49  
Medicine - Literature

"Review of 'Handbook of Agricultural Scientific  
Research Institutions of the USSR,'" D. V.  
Lebedev, 1½ pp

"Ptilroda" No 4

Considers book most timely since previous edition  
came out in 1939 and is outdated. Completion of  
information on these institutions is important due  
to their rapid expansion under the Soviet Govern-  
ment: 214 research institutions in 1939 (122 large

57/49R61

USSR/Medicine - Institutes, Research      Apr 49  
(Contd)

ones): 6,959 in 1947 (922 large ones). Book  
is devoted mainly to a description of the 922  
large agricultural research institutions. Deplores  
fact that only 2,000 copies of this 305-page  
handbook were printed.

May 49

"Utilization of Bacteria Whose Presence Is Necessary  
in Streptomycin in the Search for Streptomycin  
Formers," D. V. Lebedev,  $\frac{1}{2}$  p

"Priloda" No 5

Michurinian theory makes it possible to explain  
the fact that some bacteria require the presence  
of an antibiotic for their development. Briefly  
describes so-called streptomycin-requiring bacteria.  
Initial stage of experiments involved finding  
a new streptomycin creator, which involved the use

57/49T91

USSR/Medicine - Streptomycin (Contd)

May 49

of Actinomyces griseus. B. coli and Ps. aeruginosa  
were grown in a streptomycin solution of varying  
concentrations. Growth of streptomycin-requiring  
bacteria was not noticed in solutions containing  
actinomitic fungi other than A. griseus.

TITLE: Drift of a gyroscope having variable kinetic moment and offset mass center and subjected to constant overloads

SOURCE: IVUZ. Priborostroyeniye, v. 8, no. 6, 1965, 84-90

TOPIC TAGS: gyroscope, gyroscope error

ABSTRACT: Reaction-start gyros having variable kinetic moments of their rotors are analyzed. Systematic drifts of such a free gyroscope subjected to constant overloads are considered; the gyro mass center is offset by  $z = -a$  (see figure). Differential equations of the motion of such a gyro are set up, solved, and a formula for the drifts is derived. The drifts are due to the fact that the aerodynamic-resistance and friction

L 18542-66

ACC NR: AP6002176

torques acting during the rotor free run are projected on the axis of outer-gimbal rotation, which causes a precession of the gyroscope with relation to the inner gimbal axis. It is found that a free gyro of the above type has a continuous drift of both the outer and inner axes. Even an ideal ( $\alpha = 0$ ) gyro does not hold its axis in the constant position in space; it has an inner-axis drift. Orig. art. has: 1 figure and 32 formulas.

TITLE: The mechanical properties of Kh21G7AN5 steel at the temperature of liquid hydrogen

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 10, 1966, 41-44

TOPIC TAGS: ~~chromium steel~~ <sup>chromium steel, alloy heat treatment,</sup> manganese steel, nitrogen, <sup>chromium</sup> ~~containing~~ steel, <sup>nickel</sup> steel, mechanical property, low temperature property steel structure/Kh21G7AN5 steel

ABSTRACT: The effect of structure and heat treatment (annealing at 1050—1300C followed by water quenching) on the mechanical properties of five heats of Kh21G7AN5 steel containing 0.02—0.10% C, 19.5—22.2% Cr, 4.7—5.7% Ni, 7.0—7.8% Mn and 0.22—0.25% N<sub>2</sub> at -253C has been investigated. It was found that all the specimens, except for those with a fully austenitic structure, fail in a brittle manner at -253C regardless of the annealing temperature. Unstable elastic-plastic deformation up to the fracture was observed in all specimens at -253C. The strengthening modulus increased with increasing content of  $\delta$ -ferrite. Strength characteristics increased but ductility somewhat decreased with increasing ferrite content. For this reason, the  $\delta$ -ferrite content must not exceed 15%; this can be achieved by annealing at temperatures not exceeding 1100C. Orig. art. has: 5 figures and 1 table.

TITLE: Measurement of carrier mobility in vitreous semiconductors of the  $Tl_2SeAs_2-(Se,Te)_3$  system Report, Third All-Union Conference on Semiconductor Compounds held in Kishinev 16-21 Sept 1963

SOURCE: AN SSSR. Izv. Seriya fizicheskaya, v.28, no.8, 1964, 1288-1290

TOPIC TAGS: semiconductor conductivity, Hall constant, Hall mobility, drift mobility, selenium compound, arsenic compound, tellurium compound, thallium compound

ABSTRACT: The conductivities and Hall constants of vitreous materials having the composition  $Tl_2SeAs_2Se_3-xTe_x$  were measured at room temperature for values of x from 1.2 to 3; the Hall constant was measured at temperatures from -30 to 70°C for x = 3; and the carrier drift mobilities were measured by the method of W.E. Speare (Proc. Phys. Soc. B-70, 669, 1957) for values of x from 0 to 1.2. The Hall effect measurements were performed with alternating current in an alternating field to facilitate measurement of the weak Hall emf's ( $10^{-7}$  to  $10^{-6}$  V). The Hall mobility was found to be independent of temperature and to increase from 0.02 cm<sup>2</sup>/V sec for x = 1.2 to 0.08

1/2

L 6805-65

ACCESSION NR: AP4044637

$\text{cm}^2/\text{V sec}$  for  $x = 3$ . The drift mobility measurements were performed with samples from 20 to 40 microns thick. Carriers were produced at the surface by a flash of light not exceeding 0.1 microsec, and the drift of both electrons and holes was observed. The ratio of electron mobility to hole mobility was found to be 0.5 and independent of composition. Conduction in these materials is accordingly of the p-type. It was not possible to obtain accurate values for the mobilities themselves because both the electrons and the holes were short lived (approximately  $3 \times 10^{-5}$  sec). TITLE: Effect of impurities on the mobility of carriers in amorphous selenium

SOURCE: Fizika tverdogo tela, v. 8, no. 4, 1966, 1136-1139

TOPIC TAGS: selenium, semiconductor carrier, impurity conductivity, electron mobility,  
hole mobility, carrier lifetime, temperature dependence, impurity level

ABSTRACT: This is a continuation of earlier work by one of the authors (Kolomiyets, with T. F. Nazarova, FTT v. 2, 174, 1960) where it was established that glass-like semiconductors, unlike crystalline ones, retain their intrinsic conductivity character independently of the impurity content. The present investigation is devoted to a more detailed study of the role of impurities in the conductivity of glass-like materials. To this end, a pulsed procedure, essentially similar to that used by W. E. Spear (Proc. Phys. Soc. v. B76, 826, 1960) and J. L. Hartke (Phys. Rev. v. 125, 1177, 1962), was used to measure the dependence of the carrier mobility in glass-like selenium on the type and content of the impurities. The measurements were made on thin samples, using semitransparent electrodes. An excess carrier density was produced on one of the surfaces by illumination or by electron bombardment. The mobility was determined from the change in charge on the content of the sample. The results

Card 1/2

L 29988-66

ACC NR: AP6012474

show that an increase in the impurity content greatly reduces the mobility, and that impurities like As and Te exert a greater effect than S. The impurities also affect the effective lifetimes of both the electrons and the holes. When Te and As are introduced, the electron lifetime increases, whereas P and Tl will decrease greatly the electron lifetime. The hole lifetime decreased slightly when P was used, but did not change noticeably when S and Te were introduced. Both electron and hole mobility increased exponentially with the temperature in the range 250 - 300K. The experimental results are explained as being due to an increase in the number of shallow and deep traps resulting from introduction of the impurities. Orig. art. has: 3 figures, 3 formulas, and 1 table.

TITLE: The temperature of surface layers of worn polymers

SOURCE: Avtomobil'naya promyshlennost', no. 8, 1965, 28-29

TOPIC TAGS: polymer, friction, lubrication, temperature distribution, antifriction bearing, technetium compound

ABSTRACT: Although numerous Soviet and foreign researchers studied the friction and wear of plastics, little is known about the tolerable operating conditions (specific load  $p$ , slipping velocity  $v$ , temperatures) determining the working capability of certain polymers (particularly teflon) used in bearings. The present author investigated the resulting temperatures as a function of  $p$  and  $v$ , and the temperature distribution over the depth of the sample in tephons using a KMI-1A testing device. Results show that the temperature developed depends on all the factors under study, i.e., the specific load, slipping velocity, and lubrication conditions. However, the dominant effect on the surface layers of the polymers under study was due to the relative sliding velocity. The heat generated is basically concentrated within the surface layer at depths up to 0.4 - 0.5 mm. Orig. art. has: 2 formulas and 4 figures.

TITLE: Methods for simultaneous investigation of eyelid conditioned reflexes and the functional state of the cardiovascular system in humans

SOURCE: Zhurnal vysshey nervnoy deyatel'nosti, v. 14, no. 2, 1964, 364-368

TOPIC TAGS: eyelid, conditioned reflex, cardiovascular system, multichannel electrocardiograph, synchronous recording apparatus, electrocardiogram, sphygmogram, plethysmogram, phonocardiogram, conditioned reflex recording, eyelid position recording

ABSTRACT: A special six-channel electrocardiograph apparatus (see Enclosure) which synchronously records electrocardiograms, sphygmograms, plethysmograms, phonocardiograms, conditioned reflexes, and position of the eyelid is described. The special feature of this apparatus is that the processes are recorded by AC current of low frequency. This makes it possible to record very slow and even

Card1/47

ACCESSION NR: AP4031820

stationary processes without distortion. In this case the positions of the eyelid can be recorded as well as position change. The selected 100 cps recording frequency is high enough to ensure adequate discrimination of investigated processes and at the same time is low enough for satisfactory electrocardiograph ink reproduction. Another feature is the independent AC generator unit which prevents the appearance of extraneous pickups to which multichannel electrocardiographs are particularly sensitive.
